Direct Submission

Submitted (10-JAN-2000) Production Sequencing Facility, DOE Joint Genome Institute, 2800 Mitchell Dire, Walnut Creek, CA 94598, USA On Feb 16, 2000 this sequence version replaced gi:6686422.

* NOTE: This record contains 144 individual sequencing reads that have not been assembled into contains 144 individual sequencing reads that have not been assembled into and the order in which they appear is completely and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlat relationships among clones to be deduced.

* However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ACO20886 196382 bp DNA HTG 16-FEB-2000

On Mar 1, 1999 this sequence version replaced gi:4263453.

* NOTE: This is a "working draft" sequence. It currently

* consists of 12 contigs. The true order of the pleces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* trus of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 35 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On Dec 22, 1999 this sequence version replaced gi:5562044.

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in represent the release of this data is based on the understanding that the sequence may change as work continues. The sequence may contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments. Contig_ID: 00409 Length: 141655bp.

* NOTE: This is a 'working draft' sequence.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, segments. Contig_ID: 00212 Length: 22806bp

* NOTE: This is a 'working draft' sequence. It currently
* consists of 24 contigs. The true order of the pleces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will

Example 9; Page 14: 68pp; English.

A method has been produced for the production of recombinant eukaryotic cytoplasmic DNA viruses for vaccine production. The method involves cytoplasmic DNA viruses for vaccine into the genome of a eukaryotic inserting a construct DNA molecule into the genome of a eukaryotic cytoplasmic DNA virus, transfecting cells with the virus, and selecting a recombinant virus that does not contain the double selection marker cassette from the construct DNA. The DNA molecule preferably contains cone or more foreign DNA segments of a gene encoding an antigen of a one or more foreign DNA segments of a gene encoding an antigen of a packles. Surface antigen gene, HBV 81-82-8 surface antigen gene, tick-borne encephalitis prem gene or tick-borne compalities gene), and has a double selection marker cassette which is flanked by at least two direct repeat DNA sequences, where at least is flanked by at least two direct repeat DNA sequences on tick-borne cassette comprises a dominant selection marker gene (preferably the colour selection marker is the cassette comprises a dominant selection marker is the Escotion marker gene). The pressent sequence represents the oselp?

E. coli hph or gpt gene). The pressent sequence represents the oselp?

E. coli hph or gpt gene). The pressent sequence represents the oselp?

Example; Page 158; 206pp; English.

Example; Page 158; 206pp; English.

The synthetic early/late promoter selp was used to express the The synthetic early/late promoter selp was used to express the The synthetic early/late promoter of the plasmid prw3 was substituted the O.6kb xbar-clai adaptor fragment of the plasmid as substituted by an Xbal-clai adaptor fragment of the plasmid do oligonucleotide o-542 and o-544. The intermediate plasmid coligonucleotide o-542 and o-544. The intermediate plasmid Aatii-Sphi fragment were substituted by the Aatii-Sphi adaptor fragment were substituted by the Aatii-Sphi adaptor fragment consisting of the annealed oligonucleotide o-541 and fragment was treated with Klenow-polymerase and inserted between the Puli sites of the plasmid pr219k. The resulting plasmid was called pr2-L2. The 0.6kb Clai-Nool fragment (the called pr2-L2. The 0.6kb Clai-Nool fragment (the T7-promoter-EMC-sequence) was replaced with a synthetic promoter fragment consisting of the annealed oligonucleotide o-selpi and
                                                                                                                                                                                                  Listuage (143) of accepting sequences were subcloned and engineered so as to be transcriptionally controlled by a engineered so to be transcriptionally controlled by a engineered so to be transcriptionally controlled by a confine or vaccinia-like promoter. A strong vaccinia promoter or procession of the HBV sequences or sequence in Q67967, can be one of several vaccinia or vaccinia or vaccinia or vaccinia to promoter used to direct expression of the HBV sequences. Ithe promoter used to direct expression of the HBV sequences. Ithe promoter of vaccinia polypeptide of 7.5 kD. Another vaccinia promoter, pli, in nature directs expression of vaccinia structural promoter, pli, in nature directs expression of vaccinia structural promoter, pli, in nature directs expression of vaccinia structural content of 11 kD. Unlike p7.5, pli is active only late in viral promoter (Q67969) is a strong synthetic promoter that is active in both early and late viral replication. Its sequence is partly considered on the p7.5 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                      Prevention and treatment of hepatitis - using recombinant replicable vaccinia viruses contg. hepatitis B virus surface and core antigen nucleotide sequences

Modified cukaryotic cytoplasmic DNA virus prodn. - involves
direct molecular closing of modified DNA molecule contg.

Cytoplasmic DNA virus genome
cytoplasmic plantal.

Cytoplasmic plantal.

Cytoplasmic dearly/late promoter selp was used to express the
cytoplasmic carly/late promoter fragment of the plasmid prism was substituted
by an Xbal-Clai adaptor fragment of the plasmid of the annealed
cytomorlectide o-542 and o-544. The intermediate plasmid
cragment consisting of the annealed by the Aatil-Sphi adaptor
fragment consisting of the annealed oligonuclectide o-541 and
costs. The resulting plasmid was called plz. The Xbal-Sphi
coststing of the plasmid prisms. The resulting plasmid was
called prz-Liz. The 0.6kb Clai-Nocl fragment (the
Ty-promoter-EMC-sequence) was replaced with a synthetic promoter
Cytopmoter-EMC-sequence) was substituted by the sall-Ndel adaptor

C plog-gene of the HIV-1 MN strain. For the construction of pl2

The synthetic early/late promoter selp was used to express the gp160-gene of the HIV-1 MN strain. For the construction of pl2

The O.6bx Xbal-Clal fragment of the plasmid pring was substituted by an Xbal-clal adaptor fragment consisting of the annealed oligonucleotide o-542 and o-542 and o-544. The intermediate plasmid cangent consisting of the annealed oligonucleotide o-541 and cangent consisting of the annealed oligonucleotide o-541 and cangent was treated with Klenow-polymerase and inserted between the Poull sites of the plasmid pr219R. The resulting plasmid was called pl2. The xbal-sphin the Poull sites of the plasmid pr219R. The resulting plasmid was called pl2.-i.2. The Chromoter-EMC-called pl22. The O-68k Clal Nool fragment was treated with Rienow-polymerase and inserted between the Poull sites of the plasmid pr219R. The resulting plasmid was called pl22.-i.2. The O-68k Clal Nool fragment was treated with Rienow-polymerase and inserted between the Poull sites of the plasmid pr219R. The resulting plasmid was called pl22.-i.2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The 239bp SalI-NdeI fragment of the resulting intermediate plasmid was substituted by the SalI-NedI adaptor consisting of the annealed oligonucleotides o-830 and o-857. The resulting plasmid was called pselP-gpt-L2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Construction of the first than pox virus (FPV) P2 promoter sequence (see 041013 and 041018-20), multiple cloning sites (see 041015-16), the FPV thymidine kinase (tk) gene and the tk gene intergenic region (see also 040101-12). The P2 promoter belongs to one of the strongest natural promoters in vaccina virus (VV) infected cells. These plasmids may be used to express foreign proteins which require post-translational modification eg. Factors II, V, VII, VIII, X, X, XI, XII, XIII, proteins C and S, von Willebrand factor, plasminogen and derivatives, apolipo proteins, eg. apoAI and apoAII, and viral antigens, eg. hepatitis B- antigens and the antigens of hepatitis C and E viruses, of tickborne encephalitis (TBE) virus, antigens of HIV, HSV and whole or partial sequences of antigens which cause pertussis, infectious bronchitis, tetanus, malaria, Marck's disease and Newcastle disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 39; 92pp; English.
The sequences given in Q41027-45 are oligomers which were used in the construction of the insertion plasmids of the invention. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                         Prepn. of recombinant fowl pox virus for e.g. expression of proteins - by inserting foreign DNA into enlarged inter-genic region so FPV TK-gene remains intact and codes for entire thymidine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   36.0%; Score 27; DB 1; Length 46; llarity 85.7%; Pred. The sequences given in Q41021-25 represent mutations of the vaccinia visus (VV) P11 promoter sequence which were included in the expression visus (VV) P11 promoter. Sequence which were included in the expression plannids of the invention. The sequences were unclear when given in the specification and so represent the "best guess" of sequence. These cases of this parallel surther comprised multiple cloning sites (see Q41015-16), the plannids further comprised multiple cloning sites (see Q41015-16), the also Q41011-12. These plasmids may be used to express foreign (see also Q41011-12). These plasmids may be used to express foreign (see covered to the virial virial virial virial sequence of antigens and factor, plasminogen and derivatives, apolipo proteins, eg. apohl and factor, plasminogen and derivatives, apolipo proteins, eg. apohl and separatish antigens of tick borne encephalitis (TBE) virus, of hepatitis C and E viruses, of tick borne encephalitis (TBE) virus, cause pertussis, infectious bronchitis, tetanus, malaria, Marck's disease and Newcastle disease, these antigens being useful as vaccines. Sequence 62 BP; 14 A; 4 C; 11 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Plasmids pAl-S2 and pA2-S2 comprise gene expression cassettes suitable for association of open reading frames already having a suitable for association of open reading frames already having a translation start codon with a synthetic poxvirus promoter (S2), prior to direct molecular transfer into vaccinia virus vector vdTK by forced cloning. The S2 promoter is present in different sorientations in the two plasmids.

Sequence of plasmid pA2-S2 which comprises a first master cloning
site comprised of unique sites of a second master cloning site of
the vaccinia virus vector designated vdTK with a poxvirus promoter
operatively linked to the first master cloning site.

Modified eukaryotic cytoplasmic DNA virus prodn. - involves
direct molecular cloning of modified DNA molecule contg.

Cytoplasmic DNA virus genome

S Claim 58; Page 141; 206pp; English.

Claim 58; Page 141; 206pp; English.

C laim 58; Page 141; 206pp; English.

C comprises cleavage site that is unique in the plasmid with a Notic endonuclease cleavage site that is unique in the plasmid with a Notic site at each end. In this plasmid the DNA segment may further

C comprises a selective marker gene under transcriptional control of a poxvirus promoter. for instance pN2-spta and pN2-sptb. The DNA segment may further comprise a second poxvirus promoter operatively

C linked to a DNA sequence comprising a restriction endonuclease cleavage site, e.g. pN2gpt-54 are comprised of gene expresson cassettes suitable for association of an open reading frame having a translation start codon, with a synthetic
with a selective marker. These plasmids were constructed by first making plasmids plasmid plasmid virus pr. 5 promoter, flanked by several unique restriction sites including Noti. For the construction of plasmid plaspt-S3A, the parental plasmid plasmi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             promoter S4 prior to direct molecular transfer into a unique site in vaccinia virus vectr vorts (26 A; 34 C; 35 A; 34 C; 35 A; 36 A; 36 A; 37 A; 38 A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   02-AUG-1993 (first entry)
Sequence of a DNA segment comprising a sequence-specific
Sequence of a DNA segment comprising a sequence-specific
endonuclease cleavage site with a cleavage site for the bacterial
restriction endonuclease NotI at each end and a selective marker
gene and a second poxylus promoter in plasmid pN2-gpt-S4.
Plasmid; cloning; restriction site; ss.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 12, Note of the control of

Sequence 12, Application US/07750080A
Patent No. 5445953
GENERAL INFORMATION:
APPLICANT: DORNER, F.
APPLICANT: SCHEIFLINGER, F.
APPLICANT: SCHEIFLINGER, F.
APPLICANT: FALKNER, F. G
TITLE OF INVENTION: DIRECT MOLECULAR CLONING OF A MODIFIED
TITLE OF INVENTION: EURAROTIC CYTOPLASMIC DNA VIRUS GENOME
NUMBER OF SEQUENCES: 42
CORRESPONDENCE ADDRESS:
                APPLICANT: SCHEIFLINGER, F.
APPLICANT: FALKNER, F. G.
TITLE OF INVENTION: DIRECT MOLECULAR CLONING OF A MODIFIED
TITLE OF INVENTION: BUKARYOTIC CYTOPLASMIC DNA VIRUS GENOME
TOWNER OF SEQUENOES: 42

Patent No. 5974290
GENERAL INFORMATION:
APPLICANT: Murphy, Gerald
APPLICANT: Boynton, Alton
APPLICANT: Sengal, Anil
TITLE OF INVENTION: NOCLEOTIDE AND AMINO ACID
TITLE OF INVENTION: SEQUENCES OF A D2-2 GENE ASSOCIATED WITH
TITLE OF INVENTION: BRAIN TUMORS AND METHODS BASED THEREON
NUMBER OF SEQUENCES: 20
                                                                                                                                                                                                   APPLICANT: DORNER, F.
APPLICANT: SCHEIFLINGER, F.
APPLICANT: PALKNER, F.
TITLE OF INVENTION: DIRECT MOLECULAR CLONING OF A MODIFIED
TITLE OF INVENTION: EUKARYOTIC CYTOPLASMIC DNA VIRUS GENOME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 1; Length 134;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SOFTWARE: Patentin Release #1.0, Version #1.25

of this BAC-end sequence was carried out as part of a with the European Drosophila Genome Project (EDGP) - up.ebi.ac.uk -. This Drosophila melanogaster BAC BAC) was made by Alain Billaud at CEPH (Centre Lymorphisme Humain) with funding provided by a MRC . The DNA was prepared from embryos by Alain Bucheton Payan. It has been constructed in the vector

The sequence contained an oligo-dr track that was present in the oligouclectide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. cDNA Library Preparation: M.B. Soares Lab Clone distribution: NGI-GGAP clone distribution information can be found through the L.M.A.G.E. Consortium/Lib.a.:
Www-bio.llnl.gov/bbrp/image/image.html The following repetitive elements were found in this cDNA sequence: 15-66, >MLTIE#LTR/MalrR POLYA-Yes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDCP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: n bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm
